

# SEAL TEST

Get your entire RV tested for leaks today for only

**\$249.99 Plus Tax**

**THE SEALTECH 430R** makes ingenious use of a very simple fact: air flowing through an opening covered with a soapy water ("surfactant") solution produces a bubble precisely at the opening. The system draws outside air into the RV via the roof vent, where it is dispersed, creating a positive interior pressure. This pressure difference causes air to flow outward through any outer skin faults. The application of a soapy water solution to suspicious areas of the outer skin results in a very visible bubble exactly over each fault. Because of the large surface areas involved, and the numerous routes for air to escape a typical RV, the SEALTECH 430R is engineered and built to produce high air flow, but only to safe nominal pressures.

[Left] The damage done to a subfloor by a water leak. [Right] The SEALTECH machine in action. The bubbles shown here identify where the void in the sealant is. This allows us to address each leak accurately.
